Shortest Path Problem in Fuzzy, Intuitionistic Fuzzy and Neutrosophic Environment: An Overview

Abstract—In the last decade, concealed by uncertain atmosphere, many algorithm have been studied deeply to workout shortest path problem (SPP). In this paper, we compared shortest path problem with various existing algorithm. Finally we concluded the best algorithm for certain environment.

Keywords— Fuzzy sets; Intuitionistic Fuzzy Sets; Vague sets; Neutrosophic sets; Shortest Path Problem.

I.Introduction

SPP is a cardinal issue among familiar connectional problems which occur in different areas of engineering and science such as application in highway networks, portage and conquer in intelligence channels and problem of scheduling. The SPP focuses on recommending the path which has minimum length enclosed by two vertices. The length of the arc/edge produces the quantities of the real life namely cost, time etc. In the case of conventional method of measuring SP, the length of each bend is assumed as a crisp numbers. If there is an uncertain on the parameters in the network then the length can be represented by fuzzy number.

In the current preceding, many of the SPP with various types of input data, have been examined in junction with fuzzy, intuitionistic, vague, interval fuzzy, interval valued Intuitionistic fuzzy and neutrosophic sets [2, 3, 8-9, 11,13-14,18-20,23,30, 39, 46-52, 83-92]. Up until now plenty of new algorithms have been designed.

The paper is arranged as: Section II comprehends the primary definitions and overviewed SPP under different sets in section III, IV, V and VI respectively. Lastly conclusion has been presented for the objective of the paper.

II.Preliminaries

Here, we principally recollected some of the concepts connected to neutrosophic sets (NSs), single valued neutrosophic sets (SVNSs) related to the present work. See especially [10, 12] for further details and background.

Definition 2.1. Consider the space X consists of universal elements characterized by x . The NS A is a phenomenon which has the structure $A = \{(T_A(x), I_A(x), F_A(x)) / x \in X\}$ where the three grades of memberships are from X to $]0, 1^+[$ of the element $x \in X$ to the set A , with the criterion:

$$^-0 \leq T_A(x) + I_A(x) + F_A(x) \leq 3^+. \quad (1)$$

The functions $T_A(x)$, $I_A(x)$ and $F_A(x)$ are the truth, indeterminate and falsity grades lies in real standard/non-standard subsets of $]0, 1^+[$.

Since there is a complication of applying NSs to realistic issues, Samarandache and Wang et al. [11-12] proposed the notion of SVN, which is a specimen of NS and it is useful for realistic applications of all the fields.

Definition 2.2. For the space X of objects contains a global elements x . A SVN is represented by degrees of membership grades mentioned in Def. 2.1. For all x in X , $T_A(x), I_A(x), F_A(x) \in [0, 1]$. A SVN can be written as

$$A = \{ \langle x: T_A(x), I_A(x), F_A(x) \rangle / x \in X \} \quad (2)$$

III. SPP in vague Environment

A peculiar way for getting a shortest path (SP) of a given network was found by Dou et al. [26] in 2008, where the sets are vague. Firstly, the authors recommended the length of the SP was determined using vague sets from the source node (SN) to the destination node (DN) for conventional network with direction. Secondly, calculated the degree of resemblance among the lengths of the vague paths under vague similarity measure. Finally, it was concluded that the path which has the greater degree of similarity is a SP. A novel algorithm was constructed to identify the SP in a directed graph (DG), where the distance between the arcs is considered as vague number in triangular measure rather than real number. In 2018, Rashmanlou et al. solved SPP using Euclidean distance for vague network [57].

IV. SPP in Fuzzy Environment.

This part describes about various methods to solve SPP using fuzzy arc length by many authors. Dudois and Prade solved fuzzy SPP (FSPP) using Floyd's and Ford's algorithms firstly [5]. In the year 2000, Okada and Soper introduced an algorithm to solve FSPP in terms of multiple labeling procedure [32]. Klein [27] projected a vital programming fuzzy algorithm based on recursive concept. Lin [41] constructed a technique of fuzzy linear programming to find the fuzzy SP (FSPP) length of a network. Yao [42] contemplated two different FSPP such as SPP using triangular fuzzy numbers (TFNs) and SPP using level $(1-\beta, 1-\alpha)$ interval valued fuzzy numbers (IVFNs).

In 2003, the same author, solved FSPP by using two different types of methods namely TFNs and level $(1-\beta, 1-\alpha)$ interval valued FNs (IVFNs). Nayeem and Pal introduced an algorithm to solve SPP using notoriety index, where the lengths of the arc were taken as interval numbers or TFNs. [44]. In the year 2005, Chuang recommended a novel idea to identify FSP by finding the length of the FSP encompassed by all possible path of a given network [38]. Kung et al. established new technique to handle FSPP by representing the arc length as TFN [40]. In 2009, Yadav and Biswas conferred a new method to solve SPP by considering the edge length as FN in a directed graph instead of real number. The authors constructed an algorithm to discover an optimal path by considering both input and output are FNs [22]. Also in the same period, Lin solved SPP using interval valued FNs and endorsed distance method of defuzzification [62]. In 2010, Pandian and Rajendran introduced path classification algorithm to find the minimal path by considering crisp or uncertain weights (TFNs) from one node to another. In this method indeterminate nodes in the minimum path can be found without going backward and this is the major advantage. This would be very helpful for the decision-makers to omit indeterminate nodes [28]. Seda presented all-pairs SPP by applying fuzzy ranking method [25]. In 2012, Meenakshi and Kaliraja determined SP for IVFN (Interval Valued Fuzzy Network) [61].

In 2013, Shukla projected Floyd's algorithm to solve SPP using a concept of fuzzy sets which is based on graded mean unification of FNs [21]. In 2014, Elizabeth and Sujatha introduced a novel approach to solve FSPP by finding minimum arithmetic mean among IVFN matrices [31]. The same authors Huyen et al. gave a direction on establishing a design for SPP with TFNs as the edge weights. In this work, mathematical concept of the algorithm is developed on Defined Strict Comparative Relation Function for the set of TFNs [56]. Nayeem proposed a novel expected value algorithm for the FSSP [60].

In 2015, Mukerje [34] explored the fuzzy approach programming to solve FSPP. Here the authors converted a single-objective fuzzy linear programming (SOFLP) by considering TFNs and TpFNs as the edge weight into crisp multi-objective Linear Programming (CMOLP). Anusuya and Sathya proposed a design for SPP where the arc lengths are type-2 fuzzy numbers (T2FNs) from SN to DN in a network [54]. Also the authors established an algorithm for SPP using type reduction on the edges using centroid and centre of gravity of FS which gives the FSP where the arc lengths are represented by discrete T2FN [55]. Mahdavi et al. [16] applied dynamic programming method for finding shortest chain in a fuzzy network. In [33] Okada solved FSPPs by incorporating interactivity among path. Deng et al. [53] established fuzzy Dijkstra algorithm for solving SPP under uncertain environment. Dey et al. have contributed the following ideas: solved FSPP using IT2FSs (interval type-2 fuzzy set) as the edge weights, they have altered conventional Dijkstra's design by including impreciseness using IT2FSs to solve SPP from SN to DN, afford a new way for SPP in imprecise setting using IT2FSs for the edge weights and examined the path algebra and its generalized algorithm for FSPP [6]. Meenakshi and Kaliraja described the SP for a network under the notion of interval valued fuzzy (IVF) where the SP in lower limit fuzzy networks coexists with the case for upper limit [7]. In 2016, Dey et al. introduced a model to solve FSPP for using Interval Type-2 Fuzzy (IT2F) [59]. In 2017, Biswas proposed IVFSP in a multi graph [63]. In 2018, Eshaghnezhad et al. presented a first scientific paper for resolving of FSP by artificial network model which has the property of the global exponential stability [82].

V. SPP in Intuitionistic Fuzzy Environment.

In this part, various methods have been disclosed in literature to handle the SPP by taking intuitionistic fuzzy (IF) as the arc lengths by different authors.

In 2007, Karunambigai et al. refined an approach found on dynamic programming to solve SPP using intuitionistic fuzzy graphs (IFGs) [24]. In 2010, Gani also established a technique to identify intuitionistic fuzzy shortest path (IFSP) for a given network [3]. Mukherje pre-owned an interesting methodology to solve IFSP using the idea of Dijkstra's algorithm and intuitionistic fuzzy hybrid Geometric (IFHG) operator [45]. Majudmder and Pal [30] solved SPP for intuitionistic fuzzy network. In 2013, Biswas modified an IF method for SPP in a realistic multi graph [35]. Rangasamy at al. proposed score-based methodology to find shortest hyper paths for a given network where hyper edges are characterized by IF weights without describing similarity measure and Euclidean distance [43]. Babacioru conferred an algorithm to find the minimum arc length of an IF hyper path using MAPLE [15]. In [29], Jayagowri and GeethaRamani solved SPP on a network with the use of Trapezoidal Intuitionistic Fuzzy Numbers (TpFNs). In 2014, Porchelvi and Sudha recommended a minimum path labeling algorithm to solve SPP using triangular IF number (TIFN) [36]. Also they proposed a new and different methodology to solve SPP with TIFNs, where the authors found the minimal edge using IF distance by applying graded mean integration and examined SPP from a particular vertex to all other ones in a network [37]. In 2015, Kumar et al. suggested a design to identify the SP and shortest distance in an IVIF graph where the nodes are taken as crisp numbers and edge weights are assigned by IVITpFNs (Interval Valued Intuitionistic Trapezoidal Fuzzy Numbers) [1]. Kumar et al. proposed an algorithm for SPP using IVITpFN as the weights in a network [58].

IV. SPP in Neutrosophic Environment.

The authors modeled a design to find the ideal path where the inputs and outputs are neutrosophic numbers (NNs) [4]. In 2016, Broumi et al. solved SPP, by considering the edge weights as, SVTpNNs as the edge weights [68], Triangular fuzzy neutrosophic numbers (TFNNs) [69], bipolar neutrosophic set [70] and applied Dijkstra's method to solve NSPP and IVNSPP [67, 72]. In 2017, Broumi et al. solved SPP using SVNGs [64], by adopting SVTNNs and SVTpNNs [65-66], found an optimal solution for the NSPP using trapezoidal data under neutrosophic environment [68], by SVNN, solved the MST problem [73], by Trapezoidal fuzzy neutrosophic [74], introduced a new notion of matrix design for MST in IVNG [79], introduced computational method to MST in IV bipolar neutrosophic setting [80]. Also in [75], Broumi et al. proposed an another algorithm to solve MST problem on a network with the use of SVTpNNs. Broumi et al. [76] solved MST problem in a bipolar neutrosophic environment. Mullai et al. solved SPP by minimal spanning tree (MST) using BNS [77]. In 2018, Broumi et al. applied IVNNs and BNS SPP for a given network [70,71]. Dey et al. proposed a novel design for MST for NGs which are undirected [78]. Jeyanthi and Radhika [81] solved NSPP using Floyd's algorithm firstly.

The following table confers four types of SPP containing FSPP, IFSPP and neutrosophic SPP (NSPP) and for the case of interval numbers to all the types of parameters.

Shortest path problem on network with	Edges/vertices	Indeterminacy	Ambiguity	Uncertainty
Crisp parameters	Crisp Number (CN)	No	No	No
Interval Parameters	Interval Number (IN)	No	No	No
Fuzzy parameters (FPs)	Fuzzy Number (FN)	No	No	Yes
Interval FPs	Interval Fuzzy Number (IFN)	No	No	Yes more level
Intuitionistic fuzzy parameters (IFPs)	Intuitionistic Fuzzy Number (IFN)	No	yes	Yes
Interval IFPs	Interval Intuitionistic Fuzzy Number (IFN)	No	yes more level	yes more level
Neutrosophic parameters (NPs)	Neutrosophic Number (NN)	yes	yes	Yes
Interval NPs	Interval Neutrosophic Number (INN)	yes more level	yes more level	yes more level

From the overhead table, it is seen that the available methods could not employed to solve NSPP from SN to DN for a given network with IVNN as the edge weights.

But neutrosophic environment can able to solve SPP effectively as it handles indeterminacy together with impreciseness and ambiguity to take the best decision in identifying the SP with the use of IVNN rather than single valued NN. Effortlessly the proposed algorithm can be adapted to any kind of NNs.

V. Advantages and limitations of different types of sets.

The below table expresses the capacity of various types of sets as an advantage and their incapability to handle some conditions or important situations towards to realistic problems.

Various Types of Sets	Advantages	Limitations
Crisp sets	Can accurately determine with no hesitation	Cannot describe the uncertain Information
Fuzzy sets	Can describe the uncertain Information	Cannot describe the uncertain Information with non-membership degree
Interval valued fuzzy sets	Can able to deal interval data instead of exact data	Cannot handle the uncertain Information with non-membership degree

Intuitionistic fuzzy sets	Can describe the uncertain Information with membership (MS) and non-membership (NMS) degrees simultaneously	Cannot describe the sum of MS and NMS degrees bigger than 1
Interval valued Intuitionistic fuzzy sets	Able to handle interval data	Cannot portray the addition of MS and NMS degrees bigger than 1
Vague sets	Can describe uncertain Information with grades of MS and NMS at the same time.	Cannot describe the sum of MS and NMS degrees greater than 1.
Pythagorean fuzzy sets	It has full space to describe the sum of MS and NMS degrees greater than 1	Cannot describe the square sum of MS and NMS degrees greater than 1
Interval valued Pythagorean fuzzy sets	Capable of dealing interval data	Unable to define the square sum of MS and NMS degrees greater than 1
Neutrosophic Sets	Able to deal indeterminacy of the data and the optimized solution can be obtained completely.	Unable to handle interval data
Interval valued Neutrosophic sets	Able to deal indeterminacy of the interval data and the optimized solution can be obtained .	Unable to handle incomplete weight information

V. CONCLUSION

Crisp SPP (CSPP) can be adopted only if there exists certainty on the parameters of nodes and edges. If uncertainty exist in the arc then the authors have been recommended to use FSPP. Later FSPPs cannot be enforced for the certain message which is not endured and indecisive then the investigation invented the concept of IFSP. Later, the data about of the arc is undetermined, undecided and imprecise then the concept of NSP elevated in the literature. But all the algorithm established by the researchers is advantageous for various real time problems and occasionally the algorithm is not applicable for assured situations. Hence it is forced the recognized algorithms in various sets such as vague set (VS), FS, IFS and NS. In real world, one who clears with the data can accept the proposed algorithm by the inventors which is acceptable.

ACKNOWLEDGMENT

The authors are very grateful to the chief editor and reviewers for their comments and suggestions, which is helpful in improving the paper.
