An approach to (μ, ν, ω) -single-valued neutrosophic submodules

Muhammad Shazib Hameed¹, Zaheer Ahmad¹, Shahbaz Ali², Muhammad Kamran^{1,3}✉ & Alphonse-Roger Lula Babole⁴✉

Dealing with erroneous, unexpected, susceptible, flawed, vulnerable, and intricate information is simplified with the use of a single-valued neutrosophic set (svns). This is because of the fact that these types of information are more sensitive to error. This is due to the fact that these particular kinds of information are more prone to error. The ideas of fuzzy sets and intuitionistic fuzzy sets have both undergone further development as a direct result of the development of this new theory. In svns, indeterminacy is quantified in a way that is both obvious and unambiguous, and truth membership, indeterminacy membership, and falsity membership are all completely independent of one another. In algebraic analysis, certain binary operations can be thought of as interacting with algebraic modules. These modules are intricate and ubiquitous structures. There are many different applications for modules to be used in. Modules find use in an extremely wide variety of different kinds of businesses and market segments. We investigate the idea of (μ, ν, ω) -svns and relate it to (μ, ν, ω) -single-valued neutrosophic module and (μ, ν, ω) -single-valued neutrosophic submodule, respectively. The goals of this research are to comprehend the algebraic structures of a (μ, ν, ω) -single-valued neutrosophic submodule of a classical module and enhance the legitimacy of this technique by discussing numerous essential aspects. Both of these goals will be accomplished through the course of this study. The strategies that we have developed in this manuscript are more generalizable than those that have been utilized in the past. These strategies include fuzzy sets, intuitionistic fuzzy sets, and neutrosophic sets.

We are expressing certain symbols in the Table 1, which will be used throughout this manuscript.

The limitations of previously established fuzzy algebra structures are eradicated by the implementation of a recently proposed fuzzy algebraic structure. The use of regular mathematics is not always possible in many aspects of day-to-day life because of the prevalence of ambiguity and uncertainty in those settings. The application of a number of fuzzy algebraic structures, such as fuzzy subgroups, fuzzy rings, fuzzy sub-fields, and fuzzy sub-modules, can be very helpful in resolving issues of this nature. The ideas of the fuzzy set and the intuitionistic fuzzy set are expanded upon by use of svns, which is a powerful and comprehensive formal framework.

In the year 1980, Smarandache established the subfield of philosophy that is today known as neutrosophy. It is the cornerstone upon which such fields as neutrosophic logic, probability, set theory, and statistical analysis are built. As a consequence of this, he came up with the theory of neutrosophic logic and set, which provides an approximation of every statement of neutrosophic logic with the benefits of truth in the subcategory T, indeterminacy value in a subcategory I, and falsehood in the subcategory F. In light of the fact that the fuzzy set theory can only be used to depict situations in which there is uncertainty, the neutrosophic theory is the only viable option for describing scenarios in which there is indeterminacy. In¹, Smarandache provided an explanation of the neutrosophic idea, and in^{2,3}, Wang provided additional information on single-valued neutrosophic sets.

Researchers have already done extensive research on fuzzy and intuitionistic fuzzy sets⁴⁻⁷, fuzzy logics⁸⁻¹⁰, paraconsistent sets^{11,12}, fuzzy groups¹³⁻¹⁶, complex fuzzy sets¹⁷⁻¹⁹, fuzzy subrings and ideals²⁰⁻²⁶, single-valued neutrosophic graphs and lattices²⁷⁻²⁹, single-valued neutrosophic algebras^{30,31} and many more interesting fields.

M	Classical module	R	Commutative ring with unity

Table 1. Symbols and description of this manuscript.

The neutrosophic theory ultimately led to the development of the algebraic neutrosophic structural principle. Kandasamy and Smarandache described shifts in the paradigm of algebraic structure theory in their paper which may be found in^{1,2}. The term “svns” is used to characterize them in addition to the terms “algebraic structures” and “topological structures”^{32–34}. This concept was utilized by Çetkin, Aygün, and Çetkin in the context of neutrosophic subgroups³⁵, neutrosophic subrings³⁶, and neutrosophic submodules^{37,38} of a certain classical group, ring, and module. Several recent research on the process of group decision making with a variety of different characteristics are described in^{39–41}.

In actuality, modules are one of the most fundamental and diverse algebraic structures studied in terms of a number of binary operations. In this study, we investigate the concept of (μ, ν, ω) -single-valued neutrosophic submodules, as well as the suggested concepts basic properties and characterizations. We also demonstrate that svns may not be an svnsm of module M, but (μ, ν, ω) -svns must be an svnsm of module M. The essay is organized as follows: in “Preliminaries” section, we explain several basic ideas for svns. The “ (μ, ν, ω) -single-valued neutrosophic submodules” section explains the concept of (μ, ν, ω) -svnsm and some idealistic findings.

Preliminaries

This section covers basic definitions related to svns. In this section, we also present fundamental properties and relationships between svnss.

Definition 2.1¹ On the universe set X a svns P is defined as:

$$P = \{\langle m, T_P(m), I_P(m), F_P(m) \rangle, m \in X\},$$

where $T, I, F : X \rightarrow [0, 1]$, and $0 \leq T_P(m) + I_P(m) + F_P(m) \leq 3, \forall m \in X, T_P(m), I_P(m), F_P(m) \in [0, 1]$.

T_P, I_P, F_P represents the functions of truth, indeterminacy, and falsity-membership, respectively.

Definition 2.2² Suppose P and Q be two svnss on X and Y . The cartesian product of P and Q is then a svns on $X \times Y$, denoted by $P \times Q$ and it is defined as:

$$(P \times Q)(m, n) = P(m) \times Q(n),$$

where

$$P(m) \times Q(n) = (T_P \times Q(m, n), I_P \times Q(m, n), F_P \times Q(m, n)),$$

That is,

$$\begin{aligned} T_{P \times Q}(m, n) &= T_P(m) \wedge T_Q(n), \\ I_{P \times Q}(m, n) &= I_P(m) \wedge I_Q(n), \text{ and} \\ F_{P \times Q}(m, n) &= F_P(m) \vee F_Q(n). \end{aligned}$$

Definition 2.3³⁵ Let P be a svns on X and $\alpha \in [0, 1]$. The α -level sets on P can be determined:

$$\begin{aligned} (T_P)_\alpha &= \{m \in X \mid T_P(m) \geq \alpha\}, \\ (I_P)_\alpha &= \{m \in X \mid I_P(m) \geq \alpha\}, \text{ and} \\ (F_P)^\alpha &= \{m \in X \mid F_P(m) \leq \alpha\}. \end{aligned}$$

Proposition 2.4² Let the svnss on the common universe X be P, Q and S . Then the following conditions must hold.

- $P \cup Q = Q \cup P, P \cap Q = Q \cap P$.
- $P \cup (Q \cap S) = (P \cup Q) \cap S, P \cap (Q \cap S) = (P \cap Q) \cap S$.
- $P \cup (Q \cap S) = (P \cup Q) \cap (P \cup S), P \cap (Q \cup S) = (P \cap Q) \cup (P \cap S)$.
- $P \setminus (Q \cap S) = (P \setminus Q) \cup (P \setminus S), P \setminus (Q \cup S) = (P \setminus Q) \cap (P \setminus S)$.
- $c(P \cup Q) = c(P) \cap c(Q), c(P \cap Q) = c(P) \cup c(Q)$. Note: $c(P)$ represent complement of P .

Definition 2.5² Let P & Q be two single-valued neutrosophic sets (svnss) on X . Then

- $P \subseteq Q$, if and only if $P(m) \leq Q(m)$.
That is,

$$T_P(m) \leq T_Q(m), I_P(m) \leq I_Q(m), \text{ and } F_P(m) \geq F_Q(m).$$

Also $P = Q$ if and only if $P \subseteq Q$ and $Q \subseteq P$.

2. $P \cup Q = \{\langle \max\{T_P(m), T_Q(m)\}, \max\{I_P(m), I_Q(m)\}, \min\{F_P(m), F_Q(m)\} \rangle, \forall m \in X\}$.
3. $P \cap Q = \{\langle \min\{T_P(m), T_Q(m)\}, \min\{I_P(m), I_Q(m)\}, \max\{F_P(m), F_Q(m)\} \rangle, \forall m \in X\}$.
4. $(P \setminus Q) = \{\langle \min\{T_P(m), T_Q(m)\}, \min\{I_P(m), I_Q(m)\}, \max\{F_P(m), F_Q(m)\} \rangle, \forall m \in X\}$.
5. $c(P) = \{\langle F_P(m), 1 - I_P(m), T_P(m) \rangle, \forall m \in X\}$. Here $c(c(P)) = P$.

Definition 2.6 ³⁵ Let define a function $g : X_1 \longrightarrow X_2$ and P, Q be the svns of X_1 and X_2 , respectively. Then the image of a svns P is also a svns of X_2 and as described below:

$$\begin{aligned} g(P)(n) &= (T_{g(P)}(n), I_{g(P)}(n), F_{g(P)}(n)) \\ &= (g(T_P)(n), g(I_P)(n), g(F_P)(n)), \forall n \in X_2. \end{aligned}$$

Where

$$\begin{aligned} g(T_P)(n) &= \begin{cases} \bigvee T_P(m), & \text{if } m \in g^{-1}(n), \\ 0, & \text{otherwise.} \end{cases} \\ g(I_P)(n) &= \begin{cases} \bigvee I_P(m), & \text{if } m \in g^{-1}(n), \\ 0, & \text{otherwise.} \end{cases} \\ g(F_P)(n) &= \begin{cases} \bigwedge F_P(m), & \text{if } m \in g^{-1}(n), \\ 1, & \text{otherwise.} \end{cases} \end{aligned}$$

The preimage of a svns Q is a svns of X_1 and defined as:

$$\begin{aligned} g^{-1}(Q)(m) &= (T_{g^{-1}(Q)}(m), I_{g^{-1}(Q)}(m), F_{g^{-1}(Q)}(m)) \\ &= (T_Q(g(m)), I_Q(g(m)), F_Q(g(m))) \\ &= B(g(m)), \forall m \in X_1. \end{aligned}$$

(μ, ν, ω) -single-valued neutrosophic submodules

We define and investigate the basic properties and characterizations of a (μ, ν, ω) -svnm and (μ, ν, ω) -svnsm of a given classical module over a ring in this section. We typically start with some introductory (μ, ν, ω) -svns, the cartesian product of (μ, ν, ω) -svns, the α -level set on (μ, ν, ω) -svns, operations and properties of (μ, ν, ω) -svns, and then study crucial results, propositions, theorems and several examples related to (μ, ν, ω) -svnm and (μ, ν, ω) -svnsm of a given classical module over a ring R . In addition, we presented various homomorphism theorems for validity of (μ, ν, ω) -svnsm.

Definition 3.1 If P be a single-valued neutrosophic subset of X then (μ, ν, ω) -single-valued neutrosophic subset P of X is categorize as:

$$P^{(\mu, \nu, \omega)} = \{ \langle m, T_P^\mu(m), I_P^\nu(m), F_P^\omega(m) \rangle \mid m \in X \},$$

where

$$\begin{aligned} T_P^\mu(m) &= \vee \{T_P(m), \mu\}, \\ I_P^\nu(m) &= \vee \{I_P(m), \nu\}, \\ F_P^\omega(m) &= \wedge \{F_P(m), \omega\}, \end{aligned}$$

such that

$$0 \leq T_P^\mu(m) + I_P^\nu(m) + F_P^\omega(m) \leq 3.$$

Where $\mu, \nu, \omega \in [0, 1]$, also $T, I, F : X \rightarrow [0, 1]$, such that $T_P^\mu, I_P^\nu, F_P^\omega$ represents the functions of truth, indeterminacy, and falsity-membership, respectively.

Definition 3.2 Let X be a space of objects, with m denoting a generic entity belong to X . A (μ, ν, ω) -svns P on X is symbolized by truth T_P^μ , indeterminacy I_P^ν and falsity-membership function F_P^ω , respectively. For every m in X , $T_P^\mu(m), I_P^\nu(m), F_P^\omega(m) \in [0, 1]$, a (μ, ν, ω) -svns P write accordingly as:

$$P^{(\mu, \nu, \omega)} = \sum_i^n \langle T^\mu(m_i), I^\nu(m_i), F^\omega(m_i) \rangle / m_i, m_i \in X.$$

Definition 3.3 Let P and Q be two (μ, ν, ω) -svns on X and Y , respectively. Then the Cartesian product of $P^{(\mu, \nu, \omega)}$ and $Q^{(\mu, \nu, \omega)}$ which is denoted by $P^{(\mu, \nu, \omega)} \times Q^{(\mu, \nu, \omega)}$ is a (μ, ν, ω) -svns on $X \times Y$ and it is defined as:

$$(P^{(\mu, \nu, \omega)} \times Q^{(\mu, \nu, \omega)})(m, n) = P^{(\mu, \nu, \omega)}(m) \times Q^{(\mu, \nu, \omega)}(n).$$

where

$$P^{(\mu, \nu, \omega)}(m) \times Q^{(\mu, \nu, \omega)}(n) = (T_{P \times Q}^{\mu}(m, n), I_{P \times Q}^{\nu}(m, n), F_{P \times Q}^{\omega}(m, n)).$$

That is,

$$\begin{aligned} T_{P \times Q}^{\mu}(m, n) &= T_P^{\mu}(m) \wedge T_Q^{\mu}(n), \\ I_{P \times Q}^{\nu}(m, n) &= I_P^{\nu}(m) \wedge I_Q^{\nu}(n), \\ F_{P \times Q}^{\omega}(m, n) &= F_P^{\omega}(m) \vee F_Q^{\omega}(n). \end{aligned}$$

Definition 3.4 Let P be a (μ, ν, ω) -svns on X and $\alpha \in [0, 1]$. The α -level sets on P can be determined as:

$$\begin{aligned} (T_P^{\mu})_{\alpha} &= \{m \in X \mid T_P^{\mu}(m) \geq \alpha\}, \\ (I_P^{\nu})_{\alpha} &= \{m \in X \mid I_P^{\nu}(m) \geq \alpha\}, \\ (F_P^{\omega})^{\alpha} &= \{m \in X \mid F_P^{\omega}(m) \leq \alpha\}. \end{aligned}$$

Definition 3.5 Let P and Q be two (μ, ν, ω) -svnss on X . Then

$$1. \quad P^{(\mu, \nu, \omega)} \subseteq Q^{(\mu, \nu, \omega)} \Leftrightarrow P^{(\mu, \nu, \omega)}(m) \leq Q^{(\mu, \nu, \omega)}(m).$$

That is,

$$\begin{aligned} T_P^{\mu}(m) &\leq T_Q^{\mu}(m), \\ I_P^{\nu}(m) &\leq I_Q^{\nu}(m), \\ F_P^{\omega}(m) &\geq F_Q^{\omega}(m), \end{aligned}$$

and

$$P^{(\mu, \nu, \omega)} = Q^{(\mu, \nu, \omega)} \Leftrightarrow P^{(\mu, \nu, \omega)} \subseteq Q^{(\mu, \nu, \omega)} \text{ and } Q^{(\mu, \nu, \omega)} \subseteq P^{(\mu, \nu, \omega)}.$$

2. The union of $P^{(\mu, \nu, \omega)}$ and $Q^{(\mu, \nu, \omega)}$ is denoted by

$$S^{(\mu, \nu, \omega)} = P^{(\mu, \nu, \omega)} \cup Q^{(\mu, \nu, \omega)},$$

and defined as

$$S^{(\mu, \nu, \omega)}(m) = P^{(\mu, \nu, \omega)}(m) \vee Q^{(\mu, \nu, \omega)}(m),$$

where

$$P^{(\mu, \nu, \omega)}(m) \vee Q^{(\mu, \nu, \omega)}(m) = \{(T_P^{\mu}(m) \vee T_Q^{\mu}(m), I_P^{\nu}(m) \vee I_Q^{\nu}(m), F_P^{\omega}(m) \wedge F_Q^{\omega}(m)), \forall m \in X\}.$$

That is,

$$\begin{aligned} T_S^{\mu}(m) &= \max\{T_P^{\mu}(m), T_Q^{\mu}(m)\}, \\ I_S^{\nu}(m) &= \max\{I_P^{\nu}(m), I_Q^{\nu}(m)\}, \\ F_S^{\omega}(m) &= \min\{F_P^{\omega}(m), F_Q^{\omega}(m)\}. \end{aligned}$$

3. The intersection of $P^{(\mu, \nu, \omega)}$ and $Q^{(\mu, \nu, \omega)}$ is denoted by

$$S^{(\mu, \nu, \omega)} = P^{(\mu, \nu, \omega)} \cap Q^{(\mu, \nu, \omega)},$$

and defined as

$$S^{(\mu, \nu, \omega)}(m) = P^{(\mu, \nu, \omega)}(m) \wedge Q^{(\mu, \nu, \omega)}(m),$$

where

$$P^{(\mu, \nu, \omega)}(m) \wedge Q^{(\mu, \nu, \omega)}(m) = \{(T_P^{\mu}(m) \wedge T_Q^{\mu}(m), I_P^{\nu}(m) \wedge I_Q^{\nu}(m), F_P^{\omega}(m) \vee F_Q^{\omega}(m)), \forall m \in X\}.$$

That is,

$$\begin{aligned} T_S^{\mu}(m) &= \min\{T_P^{\mu}(m), T_Q^{\mu}(m)\}, \\ I_S^{\nu}(m) &= \min\{I_P^{\nu}(m), I_Q^{\nu}(m)\}, \\ F_S^{\omega}(m) &= \max\{F_P^{\omega}(m), F_Q^{\omega}(m)\}. \end{aligned}$$

$$4. \quad (P^{(\mu, \nu, \omega)} \setminus Q^{(\mu, \nu, \omega)}) = \{(\min\{T_P^{\mu}(m), T_Q^{\mu}(m)\}, \min\{I_P^{\nu}(m), I_Q^{\nu}(m)\}, \max\{F_P^{\omega}(m), F_Q^{\omega}(m)\}), \forall m \in X\}.$$

$$5. \quad c(P^{(\mu, \nu, \omega)}) = \{(F_P^{\omega}(m), 1 - I_P^{\nu}(m), T_P^{\mu}(m)), \forall m \in X\}. \text{ Here, } c(c(P^{(\mu, \nu, \omega)})) = P^{(\mu, \nu, \omega)}.$$

Proposition 3.6 Let the (μ, ν, ω) -svns on the common universe X be P, Q and S . Then the following conditions must satisfy.

1. $P^{(\mu, \nu, \omega)} \cup Q^{(\mu, \nu, \omega)} = Q^{(\mu, \nu, \omega)} \cup P^{(\mu, \nu, \omega)}, P^{(\mu, \nu, \omega)} \cap Q^{(\mu, \nu, \omega)} = Q^{(\mu, \nu, \omega)} \cap P^{(\mu, \nu, \omega)}$.
2. $P^{(\mu, \nu, \omega)} \cup (Q^{(\mu, \nu, \omega)} \cup S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \cup Q^{(\mu, \nu, \omega)}) \cup S^{(\mu, \nu, \omega)}, P^{(\mu, \nu, \omega)} \cap (Q^{(\mu, \nu, \omega)} \cap S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \cap Q^{(\mu, \nu, \omega)}) \cap S^{(\mu, \nu, \omega)}$.
3. $P^{(\mu, \nu, \omega)} \cup (Q^{(\mu, \nu, \omega)} \cap S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \cup Q^{(\mu, \nu, \omega)}) \cap (P^{(\mu, \nu, \omega)} \cup S^{(\mu, \nu, \omega)}), P^{(\mu, \nu, \omega)} \cap (Q^{(\mu, \nu, \omega)} \cup S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \cap Q^{(\mu, \nu, \omega)}) \cup (P^{(\mu, \nu, \omega)} \cap S^{(\mu, \nu, \omega)})$.
4. $P^{(\mu, \nu, \omega)} \setminus (Q^{(\mu, \nu, \omega)} \cap S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \setminus Q^{(\mu, \nu, \omega)}) \cup (P^{(\mu, \nu, \omega)} \setminus S^{(\mu, \nu, \omega)}), P^{(\mu, \nu, \omega)} \setminus (Q^{(\mu, \nu, \omega)} \cup S^{(\mu, \nu, \omega)}) = (P^{(\mu, \nu, \omega)} \setminus Q^{(\mu, \nu, \omega)}) \cap (P^{(\mu, \nu, \omega)} \setminus S^{(\mu, \nu, \omega)})$.
5. $c(P^{(\mu, \nu, \omega)} \cup Q^{(\mu, \nu, \omega)}) = c(P^{(\mu, \nu, \omega)}) \cap c(Q^{(\mu, \nu, \omega)}), c(P^{(\mu, \nu, \omega)} \cap Q^{(\mu, \nu, \omega)}) = c(P^{(\mu, \nu, \omega)}) \cup c(Q^{(\mu, \nu, \omega)})$.

Definition 3.7 Suppose a function $g : X_1 \rightarrow X_2$ and P, Q be the two (μ, ν, ω) -svns of X_1 and X_2 , respectively. Then the image of a (μ, ν, ω) -svns $P^{(\mu, \nu, \omega)}$ is a (μ, ν, ω) -svns of X_2 and it is defined as follows:

$$g(P^{(\mu, \nu, \omega)})(n) = (T_{g(P)}^{\mu}(n), I_{g(P)}^{\nu}(n), F_{g(P)}^{\omega}(n)) \\ = (g(T_P^{\mu})(n), g(I_P^{\nu})(n), g(F_P^{\omega})(n)), \forall n \in X_2.$$

Where

$$g(T_P^{\mu})(n) = \begin{cases} \bigvee T_P^{\mu}(m), & \text{if } m \in g^{-1}(n), \\ 0, & \text{otherwise.} \end{cases} \\ g(I_P^{\nu})(n) = \begin{cases} \bigvee I_P^{\nu}(m), & \text{if } m \in g^{-1}(n), \\ 0, & \text{otherwise.} \end{cases} \\ g(F_P^{\omega})(n) = \begin{cases} \bigwedge F_P^{\omega}(m), & \text{if } m \in g^{-1}(n), \\ 1, & \text{otherwise.} \end{cases}$$

The preimage of a (μ, ν, ω) -svns Q is a (μ, ν, ω) -svns of X_1 and defined as follows:

$$g^{-1}(Q^{(\mu, \nu, \omega)})(m) = (T_{g^{-1}(Q)}^{\mu}(m), I_{g^{-1}(Q)}^{\nu}(m), F_{g^{-1}(Q)}^{\omega}(m)) \\ = (T_Q^{\mu}(g(m)), I_Q^{\nu}(g(m)), F_Q^{\omega}(g(m))) \\ = Q^{(\mu, \nu, \omega)}(g(m)), \forall m \in X_1.$$

Note: We define and explore the notion of a (μ, ν, ω) -svns of a given classical module M over a ring R . R is used throughout this article to represent a commutative ring with unity 1.

Definition 3.8 Let M is a module over a ring R . A (μ, ν, ω) -svns P on M is called a (μ, ν, ω) -svns of M if the following conditions are satisfied:

M1: $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$. That is

$$T_P^{\mu}(0) = 1, I_P^{\nu}(0) = 1, F_P^{\omega}(0) = 0.$$

M2:

$$P^{(\mu, \nu, \omega)}(m+n) \geq P^{(\mu, \nu, \omega)}(m) \wedge P^{(\mu, \nu, \omega)}(n), \forall m, n \in M.$$

That is,

$$T_P^{\mu}(m+n) \geq T_P^{\mu}(m) \wedge T_P^{\mu}(n), \\ I_P^{\nu}(m+n) \geq I_P^{\nu}(m) \wedge I_P^{\nu}(n), \\ F_P^{\omega}(m+n) \leq F_P^{\omega}(m) \vee F_P^{\omega}(n).$$

M3:

$$P^{(\mu, \nu, \omega)}(rm) \geq P^{(\mu, \nu, \omega)}(m), \forall m \in M, r \in R.$$

That is,

$$T_P^{\mu}(rm) \geq T_P^{\mu}(m), \\ I_P^{\nu}(rm) \geq I_P^{\nu}(m), \\ F_P^{\omega}(rm) \leq F_P^{\omega}(m).$$

(μ, ν, ω) -svns(M) denotes the set of all (μ, ν, ω) -single-valued neutrosophic submodules of M .

Example 3.9 Take, for example, classical ring $R = \mathbb{Z}_4 = \{\bar{0}, \bar{1}, \bar{2}, \bar{3}\}$. Since each ring is a module on itself, we consider $M = \mathbb{Z}_4$ as a classical module. Define svns P as follows:

$$P = \{\langle 1, 1, 0 \rangle / \bar{0} + \langle 0.3, 0.2, 0.8 \rangle / \bar{1} + \langle 0.8, 0.5, 0.4 \rangle / \bar{2} + \langle 0.2, 0.1, 0.7 \rangle / \bar{3}\}.$$

It is clear that the svns P is not a svns of the module M .

Let $\mu = 0.6, \nu = 0.3$ and $\omega = 0.6$, So (μ, ν, ω) -svns become

$$P = \{\langle 1, 1, 0 \rangle / \bar{0} + \langle 0.6, 0.3, 0.6 \rangle / \bar{1} + \langle 0.8, 0.5, 0.4 \rangle / \bar{2} + \langle 0.6, 0.3, 0.6 \rangle / \bar{3}\}.$$

It is clear that the (μ, ν, ω) -svns P is a (μ, ν, ω) -svns of the module $M = Z_4$.

Definition 3.10 Let P be a (μ, ν, ω) -svns on M , then $-P^{(\mu, \nu, \omega)}$ is a (μ, ν, ω) -svns on M , defined as follows:

$$\begin{aligned} T_{-P}^{\mu}(m) &= T_P^{\mu}(-m), \\ I_{-P}^{\nu}(m) &= I_P^{\nu}(-m), \\ F_{-P}^{\omega}(m) &= F_P^{\omega}(-m), \quad \forall m \in M. \end{aligned}$$

Proposition 3.11 If P is a (μ, ν, ω) -svns of an R -module M , then $(-1)P^{(\mu, \nu, \omega)} = -P^{(\mu, \nu, \omega)}$.

Proof Let $m \in M$ be arbitrary element

$$\begin{aligned} T_{(-1)P}^{\mu}(m) &= \bigvee_{m=(-1)n} T_P^{\mu}(n) \\ &= \bigvee_{n=-m} T_P^{\mu}(m) = T_P^{\mu}(-m) \\ &= T_{-P}^{\mu}(m). \\ I_{(-1)P}^{\nu}(m) &= \bigvee_{m=(-1)n} I_P^{\nu}(n) \\ &= \bigvee_{n=-m} I_P^{\nu}(m) = I_P^{\nu}(-m) \\ &= I_{-P}^{\nu}(m) \\ F_{(-1)P}^{\omega}(m) &= \bigwedge_{m=(-1)n} F_P^{\omega}(n) \\ &= \bigwedge_{n=-m} F_P^{\omega}(m) = F_P^{\omega}(-m) \\ &= F_{-P}^{\omega}(m). \end{aligned}$$

This shows that $T_{(-1)P}^{\mu}(m) = T_{-P}^{\mu}(m)$, $I_{(-1)P}^{\nu}(m) = I_{-P}^{\nu}(m)$ and $F_{(-1)P}^{\omega}(m) = F_{-P}^{\omega}(m)$.

Thus, this holds true for each $m \in M$,

$$(-1)P^{(\mu, \nu, \omega)} = (T_{(-1)P}^{\mu}, I_{(-1)P}^{\nu}, F_{(-1)P}^{\omega}) = (T_{-P}^{\mu}, I_{-P}^{\nu}, F_{-P}^{\omega}) = -P^{(\mu, \nu, \omega)}.$$

□

Definition 3.12 Let P be a (μ, ν, ω) -svns on an R -module M with $r \in R$. Set rP as a neutrosophic set to M , define as:

$$\begin{aligned} T_{rP}^{\mu}(m) &= \bigvee \{T_P^{\mu}(n) \mid n \in M, m = rn\}, \\ I_{rP}^{\nu}(m) &= \bigvee \{I_P^{\nu}(n) \mid n \in M, m = rn\}, \\ F_{rP}^{\omega}(m) &= \bigwedge \{F_P^{\omega}(n) \mid n \in M, m = rn\}. \end{aligned}$$

Definition 3.13 Let P, Q be (μ, ν, ω) -svns on M . Then their sum $P^{(\mu, \nu, \omega)} + Q^{(\mu, \nu, \omega)}$ is a (μ, ν, ω) -svns on M , defined as follows:

$$\begin{aligned} T_{P+Q}^{\mu}(m) &= \bigvee \{T_P^{\mu}(n) \wedge T_Q^{\mu}(o) \mid m = n + o, n, o \in M\}, \\ I_{P+Q}^{\nu}(m) &= \bigvee \{I_P^{\nu}(n) \wedge I_Q^{\nu}(o) \mid m = n + o, n, o \in M\}, \\ F_{P+Q}^{\omega}(m) &= \bigwedge \{F_P^{\omega}(n) \vee F_Q^{\omega}(o) \mid m = n + o, n, o \in M\}. \end{aligned}$$

Proposition 3.14 If P and Q are (μ, ν, ω) -svns on M with $P^{(\mu, \nu, \omega)} \subseteq Q^{(\mu, \nu, \omega)}$, then $rP^{(\mu, \nu, \omega)} \subseteq rQ^{(\mu, \nu, \omega)}$, for each $r \in R$.

Proof By definition, it is obvious.

□

Proposition 3.15 If P is (μ, ν, ω) -svns on M , then $T_{rP}^\mu(rm) \geq T_P^\mu(m)$, $I_{rP}^\nu(rm) \geq I_P^\nu(m)$ and $F_{rP}^\omega(rm) \leq F_P^\omega(m)$.

Proof By definition, it is obvious. $\square$

Proposition 3.16 If P is a (μ, ν, ω) -svns on M , then $r(sP^{(\mu, \nu, \omega)}) = (rs)P^{(\mu, \nu, \omega)}$, $\forall r, s \in R$.

Proof Consider $r, s \in R$ be arbitrary whereas $m \in M$.

$$\begin{aligned} T_{r(sP)}^\mu(m) &= \bigvee_{m=rn} T_{sP}^\mu(n) \\ &= \bigvee_{m=rn} \bigvee_{n=st} T_P^\mu(t) = \bigvee_{m=r(st)} T_P^\mu(t) \\ &= T_{(rs)P}^\mu(m). \\ I_{r(sP)}^\nu(m) &= \bigvee_{m=rn} I_{sP}^\nu(n) \\ &= \bigvee_{m=rn} \bigvee_{n=st} I_P^\nu(t) = \bigvee_{m=r(st)} I_P^\nu(t) \\ &= I_{(rs)P}^\nu(m). \\ F_{r(sP)}^\omega(m) &= \bigwedge_{m=rn} F_{sP}^\omega(n) \\ &= \bigwedge_{m=rn} \bigwedge_{n=st} F_P^\omega(t) = \bigwedge_{m=r(st)} F_P^\omega(t) \\ &= F_{(rs)P}^\omega(m). \end{aligned}$$

So we have the following equalities

$$\begin{aligned} T_{r(sP)}^\mu(m) &= T_{(rs)P}^\mu(m), \\ I_{r(sP)}^\nu(m) &= I_{(rs)P}^\nu(m), \\ F_{r(sP)}^\omega(m) &= F_{(rs)P}^\omega(m). \end{aligned}$$

Therefore,

$$\begin{aligned} r(sP^{(\mu, \nu, \omega)}) &= (T_{r(sP)}^\mu, I_{r(sP)}^\nu, F_{r(sP)}^\omega), \\ \Rightarrow r(sP^{(\mu, \nu, \omega)}) &= (T_{(rs)P}^\mu, I_{(rs)P}^\nu, F_{(rs)P}^\omega) = (rs)P^{(\mu, \nu, \omega)}. \end{aligned}$$

$\square$

Proposition 3.17 If P and Q are (μ, ν, ω) -svns on M , then

1. $T_Q^\mu(rm) \geq T_P^\mu(m)$, for each $m \in M$, if and only if $T_{rP}^\mu \leq T_Q^\mu$.
2. $I_Q^\nu(rm) \geq I_P^\nu(m)$, for each $m \in M$, if and only if $I_{rP}^\nu \leq I_Q^\nu$.
3. $F_Q^\omega(rm) \leq F_P^\omega(m)$, for each $m \in M$, if and only if $F_{rP}^\omega \geq F_Q^\omega$.

Proof (1) Suppose $T_Q^\mu(rm) \geq T_P^\mu(m)$, for each $m \in M$, then

$$T_{rP}^\mu(m) = \bigvee_{m=rn, n \in M} T_P^\mu(n).$$

So,

$$T_{rP}^\mu \leq T_Q^\mu.$$

Conversely, suppose $T_{rP}^\mu \leq T_Q^\mu$. Then $T_{rP}^\mu(m) = T_Q^\mu(m)$, for each $m \in M$.
Hence,

$$T_Q^\mu(rm) \geq T_{rP}^\mu(rm) \geq T_P^\mu(m), \quad \forall m \in M \quad (\text{from Proposition 3.15}).$$

(2) Suppose $I_Q^\nu(rm) \geq I_P^\nu(m)$, for each $m \in M$, then

$$I_{rP}^\nu(m) = \bigvee_{m=rn, n \in M} I_P^\nu(n).$$

So,

$$I_{rP}^v \leq I_Q^v.$$

Conversely, suppose $I_{rP}^v \leq I_Q^v$. Then $I_{rP}^v(m) = I_Q^v(m)$, for each $m \in M$.
Hence,

$$I_Q^v(rm) \geq I_{rP}^v(rm) \geq I_P^v(m), \quad \forall m \in M \quad (\text{from Proposition 3.15}).$$

(3) Suppose $F_Q^\omega(rm) \leq I_P^\omega(m)$, for each $m \in M$, then

$$F_{rP}^\omega(m) = \bigwedge_{m=rn, n \in M} F_P^\omega(n).$$

So,

$$F_{rP}^\omega \geq F_Q^\omega.$$

Conversely, suppose $F_{rP}^\omega \geq F_Q^\omega$. Then $F_{rP}^\omega(m) = F_Q^\omega(m)$, for each $m \in M$.
Hence,

$$F_Q^\omega(rm) \leq F_{rP}^\omega(rm) \leq F_P^\omega(m), \quad \forall m \in M \quad (\text{using Proposition 3.15}).$$

□

Proposition 3.18 *If P and Q are (μ, ν, ω) -svnss on M , then $r(P^{(\mu, \nu, \omega)} + Q^{(\mu, \nu, \omega)}) = rP^{(\mu, \nu, \omega)} + rQ^{(\mu, \nu, \omega)}$, $\forall r \in R$.*

Proof Let P and Q are (μ, ν, ω) -svnss on M , $m \in M$ and $r \in R$.

$$\begin{aligned} T_{r(P+Q)}^\mu(m) &= \bigvee_{m=rn} T_{(P+Q)}^\mu(n) \\ &= \bigvee_{m=rn} \bigvee_{n=t_1+t_2} (T_P^\mu(t_1) \wedge T_Q^\mu(t_2)) \\ &= \bigvee_{m=rt_1+rt_2} (T_P^\mu(t_1) \wedge T_Q^\mu(t_2)) \\ &= \bigvee_{m=m_1+m_2} \left(\bigvee_{m_1=rt_1} (T_P^\mu(t_1) \wedge \bigvee_{m_2=rt_2} T_Q^\mu(t_2)) \right) \\ &= \bigvee_{m=m_1+m_2} (T_{rP}^\mu(m_1) \wedge T_{rQ}^\mu(m_2)) \\ &= T_{rP+rQ}^\mu(m). \\ I_{r(P+Q)}^\nu(m) &= \bigvee_{m=rn} I_{(P+Q)}^\nu(n) \\ &= \bigvee_{m=rn} \bigvee_{n=t_1+t_2} (I_P^\nu(t_1) \wedge I_Q^\nu(t_2)) \\ &= \bigvee_{m=rt_1+rt_2} (I_P^\nu(t_1) \wedge I_Q^\nu(t_2)) \\ &= \bigvee_{m=m_1+m_2} \left(\bigvee_{m_1=rt_1} (I_P^\nu(t_1) \wedge \bigvee_{m_2=rt_2} I_Q^\nu(t_2)) \right) \\ &= \bigvee_{m=m_1+m_2} (I_{rP}^\nu(m_1) \wedge I_{rQ}^\nu(m_2)) \\ &= I_{rP+rQ}^\nu(m). \\ F_{r(P+Q)}^\omega(m) &= \bigwedge_{m=rn} F_{(P+Q)}^\omega(n) \\ &= \bigwedge_{m=rn} \bigwedge_{n=t_1+t_2} (F_P^\omega(t_1) \vee F_Q^\omega(t_2)) \\ &= \bigwedge_{m=rt_1+rt_2} (F_P^\omega(t_1) \vee F_Q^\omega(t_2)) \\ &= \bigwedge_{m=m_1+m_2} \left(\bigwedge_{m_1=rt_1} (F_P^\omega(t_1) \vee \bigwedge_{m_2=rt_2} F_Q^\omega(t_2)) \right) \\ &= \bigwedge_{m=m_1+m_2} (F_{rP}^\omega(m_1) \vee F_{rQ}^\omega(m_2)) \\ &= F_{rP+rQ}^\omega(m). \end{aligned}$$

So we have the equalities

$$\begin{aligned}T_{r(P+Q)}^{\mu}(m) &= T_{rP+rQ}^{\mu}(m), \\I_{r(P+Q)}^{\nu}(m) &= I_{rP+rQ}^{\nu}(m), \\F_{r(P+Q)}^{\omega}(m) &= F_{rP+rQ}^{\omega}(m).\end{aligned}$$

Hence,

$$\begin{aligned}r(P^{(\mu, \nu, \omega)} + Q^{(\mu, \nu, \omega)}) &= (T_{r(P+Q)}^{\mu}, I_{r(P+Q)}^{\nu}, F_{r(P+Q)}^{\omega}) \\&= (T_{rP+rQ}^{\mu}, I_{rP+rQ}^{\nu}, F_{rP+rQ}^{\omega}) \\&= rP^{(\mu, \nu, \omega)} + rQ^{(\mu, \nu, \omega)}.\end{aligned}$$

□

Proposition 3.19 *If P and Q are (μ, ν, ω) -svnss on M , then*

1. $T_{rP+sQ}^{\mu}(rm + sn) \geq T_P^{\mu}(m) \wedge T_Q^{\mu}(n)$,
2. $I_{rP+sQ}^{\nu}(rm + sn) \geq I_P^{\nu}(m) \wedge I_Q^{\nu}(n)$,
3. $F_{rP+sQ}^{\omega}(rm + sn) \leq F_P^{\omega}(m) \vee F_Q^{\omega}(n)$, for each $m, n \in M, r, s \in R$.

Proof It is easy to prove with the help of Definitions 3.13, 3.12 and Proposition 3.15. □

Example 3.20 Take an example for above Proposition 3.19, classical ring $R = Z_2 = \{\bar{0}, \bar{1}\}$. Since each ring is a module on itself, we consider $M = Z_2$ as a classical module. Define svnss P and Q as follows:

$$P = \{(1, 1, 0) / \bar{0} + (0.6, 0.3, 0.6) / \bar{1} \text{ and } Q = \{(1, 1, 0) / \bar{0} + (0.8, 0.1, 0.4) / \bar{1}\}.$$

Let $\mu = 0.6, \nu = 0.3$ and $\omega = 0.6$, So (μ, ν, ω) -svnss P and Q becomes

$$P = \{(1, 1, 0) / \bar{0} + (0.6, 0.3, 0.6) / \bar{1} \text{ and } Q = \{(1, 1, 0) / \bar{0} + (0.8, 0.3, 0.4) / \bar{1}\}.$$

We can examine that for truth-membership

$$\begin{aligned}T_P^{\mu}(0) &= 1, T_P^{\mu}(1) = 0.6, T_Q^{\mu}(0) = 1, T_Q^{\mu}(1) = 0.8 \text{ and} \\T_P^{\mu}(0) \wedge T_Q^{\mu}(0) &= 1, T_P^{\mu}(0) \wedge T_Q^{\mu}(1) = 0.8, T_P^{\mu}(1) \wedge T_Q^{\mu}(0) = 0.6, \text{ and } T_P^{\mu}(1) \wedge T_Q^{\mu}(1) = 0.6.\end{aligned}$$

Also we can see that

$$T_{rP}^{\mu}(0) = 1, T_{rP}^{\mu}(1) = 0.6, T_{sQ}^{\mu}(0) = 1, T_{sQ}^{\mu}(1) = 0.8 \text{ and } T_{rP+sQ}^{\mu}(0) = 1, T_{rP+sQ}^{\mu}(1) = 0.8.$$

Case 1: Let $m = 0, n = 0$ and $r, s \in R = Z_2$, clearly $T_{rP+sQ}^{\mu}(r0 + s0) = 1 \geq T_P^{\mu}(0) \wedge T_Q^{\mu}(0) = 1$.

Case 2: Let $m = 0, n = 1$ and $r, s \in R = Z_2$, clearly $T_{rP+sQ}^{\mu}(r0 + s1) = 1 \text{ or } 0.8 \geq T_P^{\mu}(0) \wedge T_Q^{\mu}(1) = 0.8$.

Case 3: Let $m = 1, n = 0$ and $r, s \in R = Z_2$, clearly $T_{rP+sQ}^{\mu}(r1 + s0) = 1 \text{ or } 0.8 \geq T_P^{\mu}(1) \wedge T_Q^{\mu}(0) = 0.6$.

Case 4: Let $m = 1, n = 1$ and $r, s \in R = Z_2$, clearly $T_{rP+sQ}^{\mu}(r1 + s1) = 1 \text{ or } 0.8 \geq T_P^{\mu}(1) \wedge T_Q^{\mu}(1) = 0.6$.

$\Rightarrow (\mu, \nu, \omega)$ -svnss P and Q satisfy the condition

$$(1) T_{rP+sQ}^{\mu}(rm + sn) \geq T_P^{\mu}(m) \wedge T_Q^{\mu}(n),$$

Similarly we can show that for indeterminacy membership

$$(2) I_{rP+sQ}^{\nu}(rm + sn) \geq I_P^{\nu}(m) \wedge I_Q^{\nu}(n),$$

Now, we prove for the falsity membership

$$F_P^{\omega}(0) = 0, F_P^{\omega}(1) = 0.6, F_Q^{\omega}(0) = 0, F_Q^{\omega}(1) = 0.4 \text{ and}$$

$$F_P^{\omega}(0) \vee F_Q^{\omega}(0) = 0, F_P^{\omega}(0) \vee F_Q^{\omega}(1) = 0.4, F_P^{\omega}(1) \vee F_Q^{\omega}(0) = 0.6, \text{ and } F_P^{\omega}(1) \vee F_Q^{\omega}(1) = 0.6.$$

Also we can see that

$$F_{rP}^{\omega}(0) = 0, F_{rP}^{\omega}(1) = 0.6, F_{sQ}^{\omega}(0) = 0, F_{sQ}^{\omega}(1) = 0.4 \text{ and } F_{rP+sQ}^{\omega}(0) = 0, F_{rP+sQ}^{\omega}(1) = 0.$$

Case 1: Let $m = 0, n = 0$ and $r, s \in R = Z_2$, clearly $F_{rP+sQ}^{\omega}(r0 + s0) = 0 \leq F_P^{\omega}(0) \vee F_Q^{\omega}(0) = 0$.

Case 2: Let $m = 0, n = 1$ and $r, s \in R = Z_2$, clearly $F_{rP+sQ}^{\omega}(r0 + s1) = 0 \leq F_P^{\omega}(0) \vee F_Q^{\omega}(1) = 0.4$.

Case 3: Let $m = 1, n = 0$ and $r, s \in R = Z_2$, clearly $F_{rP+sQ}^{\omega}(r1 + s0) = 0 \leq F_P^{\omega}(1) \vee F_Q^{\omega}(0) = 0.6$.

Case 4: Let $m = 1, n = 1$ and $r, s \in R = Z_2$, clearly $F_{rP+sQ}^{\omega}(r1 + s1) = 0 \leq F_P^{\omega}(1) \vee F_Q^{\omega}(1) = 0.6$.

$\Rightarrow (\mu, \nu, \omega)$ -svnss P and Q satisfy the condition

$$(3) F_{rP+sQ}^{\omega}(rm + sn) \leq F_P^{\omega}(m) \vee F_Q^{\omega}(n), \text{ for each } m, n \in M, r, s \in R.$$

Proposition 3.21 *If P, Q, S are (μ, ν, ω) -svnss on M , Then, for each $r, s \in R$, the followings are satisfied;*

1. $T_S^\mu(rm + sn) \geq T_P^\mu(m) \wedge T_Q^\mu(n)$, for all $m, n \in M$ if and only if $T_{rP+sQ}^\mu \leq T_S^\mu$.
2. $I_S^\nu(rm + sn) \geq I_P^\nu(m) \wedge I_Q^\nu(n)$, for all $m, n \in M$ if and only if $I_{rP+sQ}^\nu \leq I_S^\nu$.
3. $F_S^\omega(rm + sn) \leq F_P^\omega(m) \vee F_Q^\omega(n)$, for all $m, n \in M$ if and only if $F_{rP+sQ}^\omega \geq F_S^\omega$.

Proof It is easy to prove with the help of Proposition 3.19. $\square$

Example 3.22 Take an example for above Proposition 3.21, Let us take the classical ring $R = Z_2 = \{\bar{0}, \bar{1}\}$. Since each ring is a module on itself, we consider $M = Z_2$ as a classical module. Define svnss P , Q and S as follows:

$$P = \{(1, 1, 0) / \bar{0} + (0.3, 0.2, 0.8) / \bar{1}\}, Q = \{(1, 1, 0) / \bar{0} + (0.4, 0.5, 0.4) / \bar{1}\} \text{ and } S = \{(1, 1, 0) / \bar{0} + (0.2, 0.1, 0.7) / \bar{1}\}.$$

Let $\mu = 0.6, \nu = 0.3$ and $\omega = 0.6$, So (μ, ν, ω) -svnss P , Q and S becomes

$$P = \{(1, 1, 0) / \bar{0} + (0.6, 0.3, 0.6) / \bar{1}\}, Q = \{(1, 1, 0) / \bar{0} + (0.6, 0.5, 0.4) / \bar{1}\} \text{ and } S = \{(1, 1, 0) / \bar{0} + (0.6, 0.3, 0.6) / \bar{1}\}.$$

We can see that for truth-membership

$$T_P^\mu(0) = 1, T_P^\mu(1) = 0.6, T_Q^\mu(0) = 1, T_Q^\mu(1) = 0.8, T_S^\mu(0) = 1, T_S^\mu(1) = 0.6 \text{ and } T_P^\mu(0) \wedge T_Q^\mu(0) = 1, T_P^\mu(0) \wedge T_Q^\mu(1) = 0.6, T_P^\mu(1) \wedge T_Q^\mu(0) = 0.6, \text{ and } T_P^\mu(1) \wedge T_Q^\mu(1) = 0.6.$$

Also we can see that

$$T_{rP}^\mu(0) = 1, T_{rP}^\mu(1) = 0.6, T_{sQ}^\mu(0) = 1, T_{sQ}^\mu(1) = 0.6 \text{ and } T_{rP+sQ}^\mu(0) = 1, T_{rP+sQ}^\mu(1) = 0.6.$$

Case 1: Let $m = 0, n = 0$ and $r, s \in R = Z_2$, clearly $T_S^\mu(r0 + s0) = 1 \geq T_P^\mu(0) \wedge T_Q^\mu(0) = 1$.

Case 2: Let $m = 0, n = 1$ and $r, s \in R = Z_2$, clearly $T_S^\mu(r0 + s1) = 1 \text{ or } 0.6 \geq T_P^\mu(0) \wedge T_Q^\mu(1) = 0.6$.

Case 3: Let $m = 1, n = 0$ and $r, s \in R = Z_2$, clearly $T_S^\mu(r1 + s0) = 1 \text{ or } 0.6 \geq T_P^\mu(1) \wedge T_Q^\mu(0) = 0.6$.

Case 4: Let $m = 1, n = 1$ and $r, s \in R = Z_2$, clearly $T_S^\mu(r1 + s1) = 1 \text{ or } 0.6 \geq T_P^\mu(1) \wedge T_Q^\mu(1) = 0.6$.

In all cases we can see that $T_S^\mu(rm + sn) \geq T_P^\mu(m) \wedge T_Q^\mu(n)$, $\forall m, n \in M$

$$\Leftrightarrow T_{rP+sQ}^\mu(0) = 1 \leq T_S^\mu(0) = 1, \text{ and } T_{rP+sQ}^\mu(1) = 0.6 \leq T_S^\mu(1) = 0.6.$$

$\Rightarrow (\mu, \nu, \omega)$ -svnss P , Q and S satisfy the condition

$$(1) T_S^\mu(rm + sn) \geq T_P^\mu(m) \wedge T_Q^\mu(n), \text{ for all } m, n \in M \text{ if and only if } T_{rP+sQ}^\mu \leq T_S^\mu.$$

Similarly we can show for the other clauses i.e indeterminacy membership as well as falsity membership.

Theorem 3.23 Let P be a (μ, ν, ω) -svns on M and $r, s \in R$. Then the following conditions must holds;

1. $T_{rP}^\mu \leq T_P^\mu \Leftrightarrow T_P^\mu(rm) \geq T_P^\mu(m)$,
 $I_{rP}^\nu \leq I_P^\nu \Leftrightarrow I_P^\nu(rm) \geq I_P^\nu(m)$ and
 $F_{rP}^\omega \geq F_P^\omega \Leftrightarrow F_P^\omega(rm) \leq F_P^\omega(m)$, for each $m \in M$.
2. $T_{rP+sP}^\mu \leq T_P^\mu \Leftrightarrow T_P^\mu(rm + sn) \geq T_P^\mu(m) \wedge T_P^\mu(n)$,
 $I_{rP+sP}^\nu \leq I_P^\nu \Leftrightarrow I_P^\nu(rm + sn) \geq I_P^\nu(m) \wedge I_P^\nu(n)$,
 $F_{rP+sP}^\omega \geq F_P^\omega \Leftrightarrow F_P^\omega(rm + sn) \leq F_P^\omega(m) \vee F_P^\omega(n)$.

Proof It is easy to prove with the help of Proposition 3.17 and 3.21. $\square$

Theorem 3.24 Let P be a (μ, ν, ω) -svns on M . Then P is a svnsm of $M \Leftrightarrow P$ is a single-valued neutrosophic subgroup of the additive group M , in the notion of³⁵, and meets the requirements $T_{rP}^\mu \leq T_P^\mu, I_{rP}^\nu \leq I_P^\nu$ and $F_{rP}^\omega \geq F_P^\omega$, for every $r \in R$.

Proof From the description of a single-valued neutrosophic subgroup in³⁵ also using Theorem 3.23, it is easy to proof. $\square$

Theorem 3.25 Assume that P is a (μ, ν, ω) -svns on M . Then $P \in \text{svnsm}(M) \Leftrightarrow$ the characteristic below are hold:

1. $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$.
2. $P^{(\mu, \nu, \omega)}(rm + sn) \geq P^{(\mu, \nu, \omega)}(m) \wedge P^{(\mu, \nu, \omega)}(n)$, for every $m, n \in M, r, s \in R$.

Proof Assume that P is a (μ, ν, ω) -svnsm of M and $e, f \in M$. It is clearly shows that $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$ by using the condition (M1) of Definition 3.8. The foregoing statements are also correct based on (M2) and (M3).

$$\begin{aligned} T_P^\mu(rm + sn) &\geq T_P^\mu(rm) \wedge T_P^\mu(sn) \geq T_P^\mu(m) \wedge T_P^\mu(n), \\ I_P^v(rm + sn) &\geq I_P^v(rm) \wedge I_P^v(sn) \geq I_P^v(m) \wedge I_P^v(n), \\ F_P^\omega(rm + sn) &\leq T_P^\mu(rm) \vee F_P^\omega(sn) \leq F_P^\omega(m) \vee F_P^\omega(n), \forall m, n \in M, r, s \in R. \end{aligned}$$

Hence,

$$\begin{aligned} P^{(\mu, v, \omega)}(rm + sn) &= (T_P^\mu(rm + sn), I_P^v(rm + sn), F_P^\omega(rm + sn)) \\ &\geq (T_P^\mu(m) \wedge T_P^\mu(n), I_P^v(m) \wedge I_P^v(n), F_P^\omega(m) \vee F_P^\omega(n)) \\ &= (T_P^\mu(m), I_P^v(m), F_P^\omega(m)) \wedge (T_P^\mu(n), I_P^v(n), F_P^\omega(n)) \\ &= P^{(\mu, v, \omega)}(m) \wedge P^{(\mu, v, \omega)}(n). \end{aligned}$$

$$\Rightarrow P^{(\mu, v, \omega)}(rm + sn) \geq P^{(\mu, v, \omega)}(m) \wedge P^{(\mu, v, \omega)}(n).$$

Conversely, assume $P^{(\mu, v, \omega)}$ meets the conditions (i) and (ii). Therefore the assumption is evident that $P^{(\mu, v, \omega)}(0) = \tilde{X}$.

$$\begin{aligned} T_P^\mu(m + n) &= T_P^\mu(1.m + 1.n) \geq T_P^\mu(m) \wedge T_P^\mu(n), \\ I_P^v(m + n) &= I_P^v(1.m + 1.n) \geq I_P^v(m) \wedge I_P^v(n), \\ F_P^\omega(m + n) &= F_P^\omega(1.m + 1.m) \leq F_P^\omega(m) \vee F_P^\omega(n). \end{aligned}$$

$$\text{So, } P^{(\mu, v, \omega)}(m + n) \geq P^{(\mu, v, \omega)}(m) \wedge P^{(\mu, v, \omega)}(n).$$

Furthermore, the requirement (M2) of Definition 3.8 is fulfilled. Let us now demonstrate the condition's legitimacy (M3). According to the hypothesis,

$$\begin{aligned} T_P^\mu(rm) &= T_P^\mu(rm + r0) \geq T_P^\mu(m) \wedge T_P^\mu(0) = T_P^\mu(m), \\ I_P^v(rm) &= I_P^v(rm + r0) \geq I_P^v(m) \wedge I_P^v(0) = I_P^v(m), \\ F_P^\omega(rm) &= F_P^\omega(rm + r0) \leq F_P^\omega(m) \vee F_P^\omega(0) = F_P^\omega(m), \forall m, n \in M, r \in R. \end{aligned}$$

As a result, (M3) of Definition 3.8 is achieved. $\square$

Theorem 3.26 Assume P and Q are (μ, v, ω) -svnsm of a classical module M , then $P \cap Q$ is also a (μ, v, ω) -svnsm of M .

Proof Since $P, Q \in (\mu, v, \omega)$ -svnsm(M), we have $P^{(\mu, v, \omega)}(0) = \tilde{X}$, and $Q^{(\mu, v, \omega)}(0) = \tilde{X}$.

$$\begin{aligned} T_{P \cap Q}^\mu(0) &= T_P^\mu(0) \wedge T_Q^\mu(0) = 1, \\ I_{P \cap Q}^v(0) &= I_P^v(0) \wedge I_Q^v(0) = 1, \\ F_{P \cap Q}^\omega(0) &= F_P^\omega(0) \vee F_Q^\omega(0) = 0. \end{aligned}$$

Hence $(P^{(\mu, v, \omega)} \cap Q^{(\mu, v, \omega)})(0) = \tilde{X}$ and we find that the condition (M1) of Definition 3.8 is met. Let $m, n \in M, r, s \in R$. According to Theorem 3.25, it is sufficient to demonstrate that

$$(P^{(\mu, v, \omega)} \cap Q^{(\mu, v, \omega)})(rm + sn) \geq (P^{(\mu, v, \omega)} \cap Q^{(\mu, v, \omega)})(m) \wedge (P^{(\mu, v, \omega)} \cap Q^{(\mu, v, \omega)})(n).$$

That is,

$$\begin{aligned} T_{P \cap Q}^\mu(rm + sn) &\geq T_{P \cap Q}^\mu(m) \wedge T_{P \cap Q}^\mu(n), \\ I_{P \cap Q}^v(rm + sn) &\geq I_{P \cap Q}^v(m) \wedge I_{P \cap Q}^v(n), \\ F_{P \cap Q}^\omega(rm + sn) &\leq F_{P \cap Q}^\omega(m) \vee F_{P \cap Q}^\omega(n). \end{aligned}$$

Now consider the truth, indeterminacy and falsity membership degree of the intersection,

$$\begin{aligned}
T_{P \cap Q}^{\mu}(rm + sn) &= T_P^{\mu}(rm + sn) \wedge T_Q^{\mu}(rm + sn) \\
&\geq (T_P^{\mu}(m) \wedge T_P^{\mu}(n)) \wedge (T_Q^{\mu}(m) \wedge T_Q^{\mu}(n)) \\
&= (T_P^{\mu}(m) \wedge T_Q^{\mu}(m)) \wedge (T_P^{\mu}(n) \wedge T_Q^{\mu}(n)) \\
&= T_{P \cap Q}^{\mu}(m) \wedge T_{P \cap Q}^{\mu}(n). \\
\Rightarrow T_{P \cap Q}^{\mu}(rm + sn) &\geq T_{P \cap Q}^{\mu}(m) \wedge T_{P \cap Q}^{\mu}(n) \\
I_{P \cap Q}^{\nu}(rm + sn) &= I_P^{\nu}(rm + sn) \wedge I_Q^{\nu}(rm + sn) \\
&\geq (I_P^{\nu}(m) \wedge I_P^{\nu}(n)) \wedge (I_Q^{\nu}(m) \wedge I_Q^{\nu}(n)) \\
&= (I_P^{\nu}(m) \wedge I_Q^{\nu}(m)) \wedge (I_P^{\nu}(n) \wedge I_Q^{\nu}(n)) \\
&= I_{P \cap Q}^{\nu}(m) \wedge I_{P \cap Q}^{\nu}(n). \\
\Rightarrow I_{P \cap Q}^{\nu}(rm + sn) &\geq I_{P \cap Q}^{\nu}(m) \wedge I_{P \cap Q}^{\nu}(n) \\
F_{P \cap Q}^{\omega}(rm + sn) &= F_P^{\omega}(rm + sn) \vee F_Q^{\omega}(rm + sn) \\
&\leq (F_P^{\omega}(m) \vee F_P^{\omega}(n)) \vee (F_Q^{\omega}(m) \vee F_Q^{\omega}(n)) \\
&= (F_P^{\omega}(m) \vee F_Q^{\omega}(m)) \vee (F_P^{\omega}(n) \vee F_Q^{\omega}(n)) \\
&= F_{P \cap Q}^{\omega}(m) \vee F_{P \cap Q}^{\omega}(n). \\
\Rightarrow F_{P \cap Q}^{\omega}(rm + sn) &\leq F_{P \cap Q}^{\omega}(m) \vee F_{P \cap Q}^{\omega}(n).
\end{aligned}$$

Hence, $P \cap Q \in (\mu, \nu, \omega)$ -svnsm(M).

□

Note: Let N be a nonempty subset of M is a submodule of $M \Leftrightarrow rm + sn \in N, \forall m, n \in M, r, s \in R$.

Proposition 3.27 Suppose M is a module over R . $P \in (\mu, \nu, \omega)$ -svnsm(M) $\Leftrightarrow \forall \alpha \in [0, 1]$, α -level sets of $P^{(\mu, \nu, \omega)}$, $(T_P^{\mu})_{\alpha}$, $(I_P^{\nu})_{\alpha}$ and $(F_P^{\omega})_{\alpha}$ are classical submodules of M where $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$.

Proof Let $P \in (\mu, \nu, \omega)$ -svnsm(M), $\alpha \in [0, 1]$, $m, n \in (T_P^{\mu})_{\alpha}$ and $r, s \in R$ can represent a certain element. Then

$$T_P^{\mu}(m) \geq \alpha, T_P^{\mu}(n) \geq \alpha \text{ and } T_P^{\mu}(m) \wedge T_P^{\mu}(n) \geq \alpha.$$

By using Theorem 3.25, we have

$$T_P^{\mu}(rm + sn) \geq T_P^{\mu}(m) \wedge T_P^{\mu}(n) \geq \alpha.$$

Hence,

$$rm + sn \in (T_P^{\mu})_{\alpha}.$$

As a result, with each $\alpha \in [0, 1]$, $(T_P^{\mu})_{\alpha}$ is a classical submodule of M . Similarly, for $m, n \in (I_P^{\nu})_{\alpha}$, $(F_P^{\omega})_{\alpha}$ we obtain $rm + sn \in (I_P^{\nu})_{\alpha}$, $(F_P^{\omega})_{\alpha}$ for each $\alpha \in [0, 1]$. Consequently, $(I_P^{\nu})_{\alpha}$, $(F_P^{\omega})_{\alpha}$ with each $\alpha \in [0, 1]$ are classical submodules of M .

Conversely, let $(T_P^{\mu})_{\alpha}$ with each $\alpha \in [0, 1]$ be a classical submodules of M .

Let $m, n \in M, \alpha = T_P^{\mu}(m) \wedge T_P^{\mu}(n)$. Then $T_P^{\mu}(m) = \alpha$ and $T_P^{\mu}(n) = \alpha$. Thus, $m, n \in (T_P^{\mu})_{\alpha}$.

Since $(T_P^{\mu})_{\alpha}$ is a classical submodule of M , so we have $rm + sn \in (T_P^{\mu})_{\alpha}$ for all $r, s \in R$.

$$\Rightarrow (T_P^{\mu})(rm + sn) \geq \alpha = T_P^{\mu}(m) \wedge T_P^{\mu}(n).$$

Similarly, $(I_P^{\nu})_{\alpha}$ with each $\alpha \in [0, 1]$ be a classical submodules of M .

Let $m, n \in M, \alpha = I_P^{\nu}(m) \wedge I_P^{\nu}(n)$. Then $I_P^{\nu}(m) = \alpha$ and $I_P^{\nu}(n) = \alpha$. Thus, $m, n \in (I_P^{\nu})_{\alpha}$.

Since $(I_P^{\nu})_{\alpha}$ is a classical submodule of M , so we have $rm + sn \in (I_P^{\nu})_{\alpha}$ for all $r, s \in R$.

$$\Rightarrow (I_P^{\nu})(rm + sn) \geq \alpha = I_P^{\nu}(m) \wedge I_P^{\nu}(n).$$

Now we consider $(F_P^{\omega})_{\alpha}$. Let $m, n \in M, \alpha = F_P^{\omega}(m) \vee F_P^{\omega}(n)$. Then $F_P^{\omega}(m) = \alpha, F_P^{\omega}(n) = \alpha$.

Thus $m, n \in (F_P^{\omega})_{\alpha}$. Since $(F_P^{\omega})_{\alpha}$ is a submodule of M , we have $rm + sn \in (F_P^{\omega})_{\alpha}$ for all $r, s \in R$.

Thus $(F_P^{\omega})(rm + sn) \leq \alpha = F_P^{\omega}(m) \vee F_P^{\omega}(n)$. It is also obvious that $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$.

As a result, the conditions of Theorem 3.25 are fulfilled.

□

Proposition 3.28 Assume that P and Q are two (μ, ν, ω) -svnss on X and Y , respectively. Then, for the α -levels, the following equalities are hold.

$$\begin{aligned}
(T_{P \times Q}^{\mu})_{\alpha} &= (T_P^{\mu})_{\alpha} \times (T_Q^{\mu})_{\alpha}, \\
(I_{P \times Q}^{\nu})_{\alpha} &= (I_P^{\nu})_{\alpha} \times (I_Q^{\nu})_{\alpha}, \\
(F_{P \times Q}^{\omega})_{\alpha} &= (F_P^{\omega})_{\alpha} \times (F_Q^{\omega})_{\alpha}.
\end{aligned}$$

Proof Let $(m, n) \in (T_{P \times Q}^{\mu})_{\alpha}$ be arbitrary.
So,

$$\begin{aligned} T_{P \times Q}^\mu(m, n) \geq \alpha &\Leftrightarrow T_P^\mu(m) \wedge T_Q^\mu(n) \geq \alpha, \\ &\Leftrightarrow T_P^\mu(m) \geq \alpha, T_P^\mu(n) \geq \alpha \Leftrightarrow (m, n) \in (T_P^\mu)_\alpha \times (T_Q^\mu)_\alpha. \end{aligned}$$

Now Let $(m, n) \in (I_{P \times Q}^\nu)_\alpha$ be arbitrary.
So,

$$\begin{aligned} I_{P \times Q}^\nu(m, n) \geq \alpha &\Leftrightarrow I_P^\nu(m) \wedge I_Q^\nu(n) \geq \alpha, \\ &\Leftrightarrow I_P^\nu(m) \geq \alpha, I_P^\nu(n) \geq \alpha, \Leftrightarrow (m, n) \in (I_P^\nu)_\alpha \times (I_Q^\nu)_\alpha. \end{aligned}$$

Similarly $(m, n) \in (F_{P \times Q}^\omega)^\alpha$ be arbitrary.
So,

$$\begin{aligned} F_{P \times Q}^\omega(m, n) \leq \alpha &\Leftrightarrow F_P^\omega(m) \vee F_Q^\omega(n) \leq \alpha, \\ &\Leftrightarrow F_P^\omega(m) \leq \alpha, F_P^\omega(n) \leq \alpha \Leftrightarrow (m, n) \in (F_P^\omega)^\alpha \times (F_Q^\omega)^\alpha. \end{aligned}$$

□

Proposition 3.29 Let P and Q be two (μ, ν, ω) -svnss on X and Y , respectively and $g : X \rightarrow Y$ be a mapping. Therefore the preceding must be applicable:

1.
$$\begin{aligned} g((T_P^\mu)_\alpha) &\subseteq (T_{g(P)}^\mu)_\alpha, \\ g((I_P^\nu)_\alpha) &\subseteq (I_{g(P)}^\nu)_\alpha, \\ g((F_P^\omega)^\alpha) &\supseteq (F_{g(P)}^\omega)^\alpha. \end{aligned}$$
2.
$$\begin{aligned} g^{-1}((T_Q^\mu)_\alpha) &= (T_{g^{-1}(Q)}^\mu)_\alpha, \\ g^{-1}((I_Q^\nu)_\alpha) &= (I_{g^{-1}(Q)}^\nu)_\alpha, \\ g^{-1}((F_Q^\omega)^\alpha) &= (F_{g^{-1}(Q)}^\omega)^\alpha. \end{aligned}$$

Proof (1) Let $n \in g((T_P^\mu)_\alpha)$. Then $\exists m \in (T_P^\mu)_\alpha$ such that $g(m) = n$. Hence $T_P^\mu(m) \geq \alpha$.
So, $\bigvee_{m \in g^{-1}(n)} T_P^\mu(m) \geq \alpha$. That is, $T_{g(P)}^\mu(n) \geq \alpha$ and $n \in (T_{g(P)}^\mu)_\alpha$. Hence $g((T_P^\mu)_\alpha) \subseteq (T_{g(P)}^\mu)_\alpha$.
Similarly, $n \in g((I_P^\nu)_\alpha)$. Then $\exists m \in (I_P^\nu)_\alpha$ such that $g(m) = n$. Thus $I_P^\nu(m) \geq \alpha$.
So, $\bigvee_{m \in g^{-1}(n)} I_P^\nu(m) \geq \alpha$. That is, $I_{g(P)}^\nu(n) \geq \alpha$ and $n \in (I_{g(P)}^\nu)_\alpha$. So $g((I_P^\nu)_\alpha) \subseteq (I_{g(P)}^\nu)_\alpha$.
Also, $n \in g((F_P^\omega)^\alpha)$. Then $\exists m \in (F_P^\omega)^\alpha$ such that $g(m) = n$. This implies $F_P^\omega(m) \leq \alpha$.
So, $\bigwedge_{m \in g^{-1}(n)} F_P^\omega(m) \leq \alpha$. That is, $F_{g(P)}^\omega(n) \leq \alpha$ and $n \in (F_{g(P)}^\omega)^\alpha$. Hence $g((F_P^\omega)^\alpha) \supseteq (F_{g(P)}^\omega)^\alpha$.
(2)

$$\begin{aligned} (T_{g^{-1}(Q)}^\mu)_\alpha &= \{m \in X : T_{g^{-1}(Q)}^\mu(m) \geq \alpha\} \\ &= \{m \in X : T_Q^\mu(g(m)) \geq \alpha\} \\ &= \{m \in X : g(m) \in (T_Q^\mu)_\alpha\} \\ &= \{m \in X : m \in g^{-1}((T_Q^\mu)_\alpha)\} \\ &= g^{-1}((T_Q^\mu)_\alpha). \end{aligned}$$

Similarly,

$$\begin{aligned} (I_{g^{-1}(Q)}^\nu)_\alpha &= \{m \in X : I_{g^{-1}(Q)}^\nu(m) \geq \alpha\} \\ &= \{m \in X : I_Q^\nu(g(m)) \geq \alpha\} \\ &= \{m \in X : g(m) \in (I_Q^\nu)_\alpha\} \\ &= \{m \in X : m \in g^{-1}((I_Q^\nu)_\alpha)\} \\ &= g^{-1}((I_Q^\nu)_\alpha). \end{aligned}$$

Also,

$$\begin{aligned}
 (F_{g^{-1}(Q)}^\omega)^\alpha &= \{m \in X : F_{g^{-1}(Q)}^\omega(m) \leq \alpha\} \\
 &= \{m \in X : F_Q^\omega(g(m)) \leq \alpha\} \\
 &= \{m \in X : g(m) \in (F_Q^\omega)^\alpha\} \\
 &= \{m \in X : m \in g^{-1}((F_Q^\omega)^\alpha)\} \\
 &= g^{-1}((F_Q^\omega)^\alpha).
 \end{aligned}$$

□

Theorem 3.30 Let $P, Q \in (\mu, \nu, \omega)$ -svnsm(M). Then the product $P \times Q$ is also a (μ, ν, ω) -svnsm(M) of M .

Proof We know that direct product of two submodule is a module. By using Proposition 3.27, suppose M is a module over R . $P \in (\mu, \nu, \omega)$ -svnsm(M) $\Leftrightarrow \forall \alpha \in [0, 1]$, α -level sets of $P^{(\mu, \nu, \omega)}$, $(T_P^\mu)_\alpha$, $(I_P^\nu)_\alpha$ and $(F_P^\omega)^\alpha$ are classical submodules of M where $P^{(\mu, \nu, \omega)}(0) = \tilde{X}$. Also by using Proposition 3.28, assume that P and Q are two (μ, ν, ω) -svnss on X and Y , respectively. Then, for the α -levels, the following equalities are hold.

$$\begin{aligned}
 (T_{P \times Q}^\mu)_\alpha &= (T_P^\mu)_\alpha \times (T_Q^\mu)_\alpha, \\
 (I_{P \times Q}^\nu)_\alpha &= (I_P^\nu)_\alpha \times (I_Q^\nu)_\alpha, \\
 (F_{P \times Q}^\omega)^\alpha &= (F_P^\omega)^\alpha \times (F_Q^\omega)^\alpha.
 \end{aligned}$$

So, by combining these two result we get that $P \times Q$ is a (μ, ν, ω) -svnsm(M) of M . □

Theorem 3.31 Assume $g : M \rightarrow N$ be a homomorphism of modules whereas M, N be the classical modules. If P is a (μ, ν, ω) -svnsm of M , then the image $g(P)$ is a (μ, ν, ω) -svnsm of N .

Proof It is sufficient to prove by Proposition 3.27,

$$(T_{g(P)}^\mu)_\alpha, (I_{g(P)}^\nu)_\alpha, (F_{g(P)}^\omega)^\alpha$$

are (μ, ν, ω) -svnsm of N , $\forall \alpha \in [0, 1]$.

Let $n_1, n_2 \in (T_{g(P)}^\mu)_\alpha$. Then $T_{g(P)}^\mu(n_1) \geq \alpha$ and $T_{g(P)}^\mu(n_2) \geq \alpha$. There exist $m_1, m_2 \in M$ such that

$$T_P^\mu(m_1) \geq T_{g(P)}^\mu(n_1) \geq \alpha \text{ and } T_P^\mu(m_2) \geq T_{g(P)}^\mu(n_2) \geq \alpha.$$

So,

$$T_P^\mu(m_1) \geq \alpha, T_P^\mu(m_2) \geq \alpha \text{ and } T_P^\mu(m_1) \wedge T_P^\mu(m_2) \geq \alpha.$$

Since P is a (μ, ν, ω) -svnsm of M , for any $r, s \in R$, we have

$$T_P^\mu(rm_1 + sm_2) \geq T_P^\mu(m_1) \wedge T_P^\mu(m_2) \geq \alpha.$$

Hence,

$$\begin{aligned}
 rm_1 + sm_2 &\in (T_P^\mu)_\alpha. \\
 \Rightarrow g(rm_1 + sm_2) &\in g((T_P^\mu)_\alpha) \subseteq (T_{g(P)}^\mu)_\alpha \\
 \Rightarrow rg(m_1) + sg(m_2) &\in (T_{g(P)}^\mu)_\alpha \\
 \Rightarrow rn_1 + sn_2 &\in (T_{g(P)}^\mu)_\alpha.
 \end{aligned}$$

Therefore, $(T_{g(P)}^\mu)_\alpha$ is a submodule of N .

Similarly, $\forall \alpha \in [0, 1]$, consider $n_1, n_2 \in (I_{g(P)}^\nu)_\alpha$. Then $I_{g(P)}^\nu(n_1) \geq \alpha$ and $I_{g(P)}^\nu(n_2) \geq \alpha$. There exist $m_1, m_2 \in M$ such that

$$I_P^\nu(m_1) \geq I_{g(P)}^\nu(n_1) \geq \alpha \text{ and } I_P^\nu(m_2) \geq I_{g(P)}^\nu(n_2) \geq \alpha.$$

So

$$I_P^\nu(m_1) \geq \alpha, I_P^\nu(m_2) \geq \alpha \text{ and } I_P^\nu(m_1) \wedge I_P^\nu(m_2) \geq \alpha.$$

Since P is a (μ, ν, ω) -svnsm of M , for any $r, s \in R$, we have

$$I_P^\nu(rm_1 + sm_2) \geq I_P^\nu(m_1) \wedge I_P^\nu(m_2) \geq \alpha.$$

Hence,

$$\begin{aligned}
rm_1 + sm_2 &\in (I_P^v)_\alpha. \\
\Rightarrow g(rm_1 + sm_2) &\in g((I_P^v)_\alpha) \subseteq (I_{g(P)})_\alpha \\
\Rightarrow rg(m_1) + sg(m_2) &\in (I_{g(P)})_\alpha \\
\Rightarrow rn_1 + sn_2 &\in (I_{g(P)}^v)_\alpha.
\end{aligned}$$

Therefore, $(I_{g(P)}^v)_\alpha$ is a submodule of N .

Similarly, for all $\alpha \in [0, 1]$, consider $n_1, n_2 \in (n_{g(P)}^\omega)^\alpha$. Then $n_{g(P)}^\omega(n_1) \leq \alpha$ and $n_{g(P)}^\omega(n_2) \leq \alpha$. There exist $m_1, m_2 \in M$ such that

$$F_P^\omega(m_1) \leq F_{g(P)}^\omega(n_1) \leq \alpha$$

and

$$F_P^\omega(m_2) \leq F_{g(P)}^\omega(n_2) \leq \alpha.$$

So $F_P^\omega(m_1) \leq \alpha$, $F_P^\omega(m_2) \leq \alpha$ and $F_P^\omega(m_1) \vee F_P^\omega(m_2) \leq \alpha$. Since P is a (μ, ν, ω) -svnsm of M , for any $r, s \in R$, we have $F_P^\omega(rm_1 + sm_2) \leq F_P^\omega(m_1) \vee F_P^\omega(m_2) \leq \alpha$.

Hence,

$$\begin{aligned}
rm_1 + sm_2 &\in (F_P^\omega)_\alpha. \\
\Rightarrow g(rm_1 + sm_2) &\in g((F_P^\omega)_\alpha) \supseteq (F_{g(P)})_\alpha \\
\Rightarrow rg(m_1) + sg(m_2) &\in (F_{g(P)})_\alpha \\
\Rightarrow rn_1 + sn_2 &\in (F_{g(P)}^\omega)_\alpha.
\end{aligned}$$

Therefore, $(F_{g(P)}^\omega)^\alpha$ is a submodule of N . So, for every $\alpha \in [0, 1]$, $(T_{g(P)}^\mu)_\alpha (I_{g(P)}^v)_\alpha (F_{g(P)}^\omega)^\alpha$ are classical submodules of N . Thus $g(P)$ is a (μ, ν, ω) -svnsm of N via the use of Proposition 3.27. $\square$

Theorem 3.32 Assume $g : M \rightarrow N$ be a homomorphism of modules whereas M, N be the classical modules. If Q is a (μ, ν, ω) -svnsm of N , then the preimage $g^{-1}(Q)$ is a (μ, ν, ω) -svnsm of M .

Proof Using Proposition 3.29 (2), we have

$$\begin{aligned}
g^{-1}((T_Q^\mu)_\alpha) &= (T_{g^{-1}(Q)}^\mu)_\alpha, \\
g^{-1}((I_Q^v)_\alpha) &= (I_{g^{-1}(Q)}^v)_\alpha, \\
g^{-1}((F_Q^\omega)_\alpha) &= (F_{g^{-1}(Q)}^\omega)_\alpha.
\end{aligned}$$

Since preimage of a (μ, ν, ω) -svnsm is a (μ, ν, ω) -svnsm, by Proposition 3.27 we arrive at a conclusion. $\square$

Corollary 3.33 If $g : M \rightarrow N$ is a surjective module homomorphism and $\{P_i : i \in I\}$ is a family of (μ, ν, ω) -svnsm of M , then $g(\cap P_i)$ is a (μ, ν, ω) -svnsm of N .

Corollary 3.34 If $g : M \rightarrow N$ is a homomorphism of modules and $\{Q_j : j \in I\}$ is a family of (μ, ν, ω) -svnsm of N , then $g^{-1}(\cap Q_j)$ is a (μ, ν, ω) -svnsm of M .

Conclusions

A (μ, ν, ω) -svns is a type of svns that can be used to tackle real-world challenges in research, engineering, denoising, clustering, segmentation, and a range of medical image-processing applications. Therefore, the study of (μ, ν, ω) -svnss and their characteristics has a significant influence, both in terms of gaining an understanding of the fundamentals of vulnerability and the applications that can benefit from this knowledge. As a continuation of the research that was carried out in^{35–38}, we intend to propose and investigate the idea of a (μ, ν, ω) -svnsm. In this article, we defined (μ, ν, ω) -svnm and (μ, ν, ω) -svnsm and offered a number of fundamental results that are connected to these ideas. As a consequence of this, the purpose of this study is to make use of a variety of different concepts in order to acquire some pertinent outcomes about (μ, ν, ω) -svnsm that are of significant worth in the field of research. In the realm of algebraic structure theory, it possesses a fantastic novel idea that has the potential to be utilized in the future for the solution of a variety of algebraic issues.

- This approach is frequently extended to the generators of arbitrary nonempty families of neutrosophic submodules as well as structure maintaining features such as isomorphism of neutrosophic submodules. Neutrosophic submodules give a solid mathematical framework for clarifying related scientific issues in image processing, control theory, and economics.
- This notion can be expanded to soft neutrosophic modules, weak soft neutrosophic modules, strong soft neutrosophic modules, soft neutrosophic module homomorphism, and soft neutrosophic module isomorphism. Furthermore, scholars might explore the homological properties of these modules.

- This study can be broadened to include the cyclic fuzzy neutrosophic normal soft group, neutrosophic rings, and ideals.
- In the future, researchers may extend this concept to topological spaces, fields, and vector spaces.
